

DYNAMIC ALLOCATION STRATEGY OVERVIEW

Astor Dynamic Allocation, our flagship strategy, takes a macroeconomic-based approach to asset allocation using the Astor Economic Index® (AEI). The strategy seeks to capture a portion of market returns during economic expansions and, more importantly, the strategy seeks to avoid large equity losses during economic contractions/recessions. The strategy adjusts portfolio beta throughout economic cycles by utilizing a broad range of asset classes. It is tactical in nature and can be up to 90% equity exposure and as low as 0% equity exposure.

- The strategy seeks to offers downside protection – strategically reducing risk as the economy weakens in order to minimize portfolio exposure to potentially wealth destroying events.
- Seeks to produce more favorable risk-adjusted returns (higher average return and lower volatility) than broad equity and alternative benchmarks.
- Seeks to create smoother returns by increasing allocations to more stock (risk assets) when you want them during times of economic strength and adjust to more fixed income.
- The strategy seeks to capture positive returns during economic expansions and reduce losses during economic contractions/recessions.

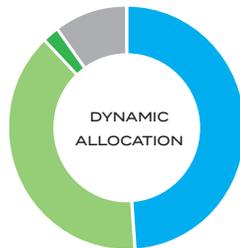

PORTFOLIO CONSTRAINTS

AS OF 9/30/2020

Equities	0 - 90%
Cash & Fixed Income	0 - 100%
Real Estate	0 - 10%
Commodities	0 - 9%
Currencies	0 - 3%
Inverse Equity	0 - 30%

TARGET ALLOCATIONS

CATEGORY	SEPTEMBER 2020	AUGUST 2020
Equity	49.0%	40.0%
Fixed Income	39.0%	48.0%
Cash	2.0%	2.0%
Commodity	10.0%	10.0%

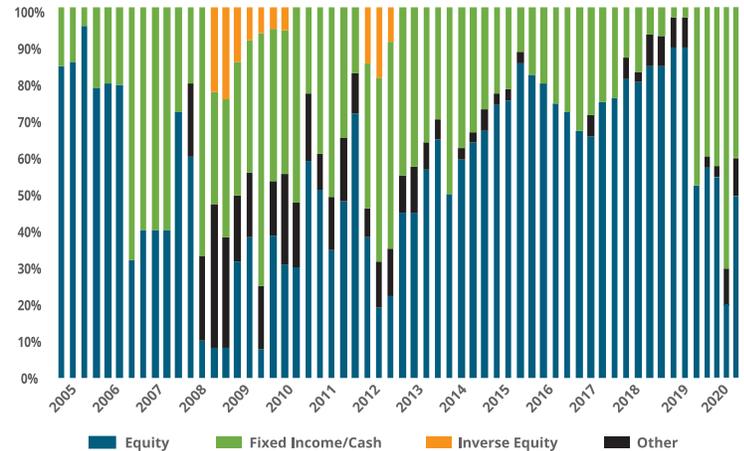

The allocations presented are target allocations for the period indicated as determined by Astor's Investment Committee. Any individual investor's portfolio may be allocated differently than presented here due to many factors, including but not limited to, timing of entry into the investment program, discretionary decisions by the clients and referring advisors, and custodial limitations or the manner in which trades are executed. Allocations do not include cash or cash equivalents. Allocations are subject to change without notice.

*All information presented is calculated based on the asset allocations of each calendar quarter ending date only and do not account for the asset allocations during the quarter. Asset allocations are no indication of portfolio performance. See accompanying disclosures for asset class definitions. For the historical allocation presented, from the third quarter 2010 going forward, the composite allocation is shown. Prior to this period, holdings from representative accounts that were invested in the model were used to calculate the allocations shown.

¹The HFRI performance shown is as of the flash estimate published on 10/7/20. Source: Bloomberg, Astor. The performance data shown is through 9/30/2020 and represents past performance for the composites(s) defined on the following page. Current performance may be lower or higher than the performance data quoted above. Past Performance is no guarantee of future results. Net of fee performance assumes the reinvestment of dividends. Gross of fee returns are shown as supplemental information only and represent "pure gross" returns. Pure gross returns are calculated before the deduction of all fees. Please refer to the accompanying disclosures for additional information concerning these results.

GLOSSARY OF TERMS:

Astor Economic Index®: The Astor Economic Index® is a proprietary index created by Astor Investment Management LLC. It represents an aggregation of various economic data points: including output and employment indicators. The Astor Economic Index® is designed to track the varying levels of growth within the U.S. economy by analyzing current trends against historical data. The Astor Economic Index® is not an investable product. When investing, there are multiple factors to consider. The Astor Economic Index® should not be used as the sole determining factor for your investment decisions. The Index is based on retroactive data points and may be subject to hindsight bias. There is no guarantee the Index will produce the same results in the future. The Astor Economic Index® is a tool created and used by Astor. All conclusions are those of Astor and are subject to change.

Cash: An allocation of uninvested U.S. dollars or an investment in an exchange-traded fund that invests primarily in short-term debt instruments.

Commodity: An investment in an exchange-traded fund that invests primarily in physical commodities such as precious metals, agriculture crops, livestock, and energy sources.

Equity: An investment in an exchange-traded fund that invests primarily in the shares of publicly-traded companies.

Fixed Income: An investment in an exchange-traded fund that invests primarily in debt instruments of a corporation or government entity where funds are borrowed from investors for a defined period of time at a fixed interest rate.

Inverse: An investment in an exchange-traded fund (ETF) that attempts to replicate the opposite price movement of a benchmark on a daily basis. An inverse S&P 500 ETF, for example, seeks a daily percentage movement opposite of the S&P 500 Index.

Maximum Drawdown: The largest percentage retracement within an investment record calculated from a portfolio value high to a subsequent portfolio value low.

Other: An investment in an exchange-traded funds consisting of asset classes other than equity, fixed income, and cash such as commodities, currencies, and real estate.

Sortino Ratio: the statistical tool that measures the performance of the investment relative to the downward deviation. Unlike Sharpe, it doesn't take into account the total volatility in the investment.

Standard Deviation: A statistical measure of the historical volatility of a security or portfolio, computed using monthly returns since inception and presented as an annualized figure.

DISCLOSURES:

Astor Investment Management, LLC ("Astor") is defined for GIPS purposes as a registered investment adviser with the U.S. Securities and Exchange Commission.

Valuations are computed and performance is reported in U.S. dollars. Performance results assume the reinvestment of dividends. Certain client accounts may take dividends as distributions. Gross-of-fee returns are shown as supplemental information only and represent "pure gross" returns. "Pure gross" returns are calculated before the deduction of all fees, including trading, advisory, and administrative fees. A small number of client accounts may pay for trading costs as individual expenses and the gross-of-fees returns for these accounts would be net of trading expenses. Net-of-fee returns for the period January 1, 2005 to June 30, 2010 are calculated by deducting all actual fees paid. For the period July 1, 2010 to June 30, 2018 net-of-fees returns are calculated by reducing quarterly gross-of-fees returns by a 2% annual model fee. For the period July 1, 2018 to June 30, 2020 net-of-fees returns are calculated by reducing monthly gross-of-fees returns by a 2% annual model. The model fee is representative of the actual fees charged to client accounts which cover trading, advisory, and other costs. The model fee produces a more conservative estimate of performance than previously reported. Generally, accounts will pay for transaction costs within a bundled fee which may also include items such as advisory, administrative, and custodial fees. In addition to these expenses, Astor primarily purchases securities which contain embedded expenses. These costs result in a layering of fees. Please note performance results include accounts which pay trading costs separately and accounts which pay a bundled fee inclusive of advisory and trading costs. No performance-based fees are assessed. The annual fee paid by clients will typically range from 1.00%-3.00% of the clients' assets under management. Astor receives a portion of this total fee as compensation for provided advisory services. Astor's annual management fee varies based upon custodial arrangements, account size, and other factors. The composite includes accounts which were direct advisory clients of Astor and accounts which receive Astor's services as part of a wrap fee or sub-advisory program.

The Astor Dynamic Allocation Composite is a multi-asset, tactical allocation strategy that exclusively uses exchange-traded funds (ETFs). The Composite will invest in a mix of asset classes, including equity, fixed income, commodities and currencies depending on the economic and market environment. During economic contractions, the Composite seeks to reduce risk by utilizing defensive positioning such as inverse equity and fixed income. The strategy may employ the use of unleveraged inverse exchange-traded funds, designed to track a single multiple of the daily inverse performance of a given index. The portfolio manager, may at their discretion, depart from the targeted allocation range when they feel that certain sections of the financial markets are over or under valued. For purposes of defining the composite of accounts, a minimum account size of \$25,000 is imposed monthly. The benchmark is the HFRI Macro (Total) Index. The HFRI Macro (Total) Index is an unmanaged, equal-weighted composite of funds listed in the HFRI Database having either \$50 million or greater in assets or a 12-month track record. HFRI is a registered trademark of Hedge Fund Research, Inc. Prior to 12/31/12, the benchmark was a 60%/40% blend of the S&P 500 Index and the Barclays Capital U.S. Aggregate Bond Index, respectively, rebalanced monthly. The benchmark was changed to help clients better assess how Astor's performance matches against other managers using similar portfolio management tactics. The performance of the S&P 500 is presented because it is a widely used benchmark and indicator of market performance. The S&P 500 Index is an unmanaged composite of 500 large capitalization companies. S&P 500 is a registered trademark of McGraw-Hill, Inc.

From December 31, 2004 to September 30, 2010, the Portfolio Managers were affiliated with a prior firm. During this time the Portfolio Managers were the only individuals responsible for selecting the securities to buy and sell. Such performance should not be interpreted as the actual historical performance of Astor Investment Management. From October 1, 2010 to July 31, 2013, the firm was a wholly-owned, indirect subsidiary of Knight Capital Group, Inc. For the period from December 31, 2004 to September 30, 2010, the presented performance is based upon a composite of accounts under management, which was defined to include all accounts in which the model allocations could be fully implemented, and excludes any accounts in

which clients have chosen to implement reasonable restrictions or those accounts that could not receive timely and accurate electronic data from the account custodian.

The Dynamic Allocation Strategy seeks to achieve its objectives by investing in Exchange-Traded Funds ("ETFs"). An ETF is a type of Investment Company which attempts to achieve a return similar to a set benchmark or index. The value of an ETF is dependent on the value of the underlying assets held. ETFs are subject to investment advisory and other expenses which results in a layering of fees for clients. As a result, your cost of investing in the Strategy will be higher than the cost of investing directly in ETFs and may be higher than securities with similar investment objectives. ETFs may trade for less than their net asset value. Although ETFs are exchanged traded, a lack of demand can prevent daily pricing and liquidity from being available. The Strategy can purchase ETFs with exposure to equities, fixed income, commodities, currencies, developed/emerging international markets, real estate, and specific sectors. The underlying investments of these ETFs will have different risks. Equity prices can fluctuate for a variety of reasons including market sentiment and economic conditions. The prices of small and mid-cap companies tend to be more volatile than those of larger, more established companies. It is important to note that bond prices move inversely with interest rates and fixed income ETFs can experience negative performance in a period of rising interest rates. High yield bonds are subject to higher risk of principal loss due to an increased chance of default. Commodity ETFs generally gain exposure through the use of futures which can have a substantial risk of loss due to leverage. Currencies can fluctuate with changing monetary policies, economic conditions, and other factors. International markets have risks due to currency valuations and political or economic events. Emerging markets typically have more risk than developed markets. Real estate investments can experience losses due to lower property prices, changes in interest rates, economic conditions, and other factors. Investments in specific sectors can experience greater levels of volatility than broad-based investments due to their more narrow focus.

The Strategy can also purchase unleveraged, inverse fixed income and equity ETFs. Inverse ETFs attempt to profit from the decline of an asset or asset class by seeking to track the opposite performance of the underlying benchmark or index. Inverse products attempt to achieve their stated objectives on a daily basis and can face additional risks due to this fact. The effect of compounding over a long period can cause a large dispersion between the ETF and the underlying benchmark or index. Inverse ETFs may lose money even when the benchmark or index performs as desired. Inverse ETFs have potential for significant loss and may not be suitable for all investors.

Investors should carefully consider the investment objectives, risks, charges, and expenses of the ETFs held within Astor's strategies before investing. This information can be found in each fund's prospectus.

The performance of the HFRI Total Macro Index is as of the flash estimate published on 10/7/20. The HFRI Total Macro Index is published as an estimate three times during each month and is subject to ongoing revisions until returns are finalized on the first business day of the fifth month after a specified calendar month. The performance of the index presented here may be materially different than what is available elsewhere if revisions have been made.

The performance of the 60/40 Index is calculated by summing the returns of 60% of the S&P 500 Total Return Index and 40% of the Barclays Capital U.S. Aggregate Bond Index on a monthly basis. This custom benchmark is often used for comparison purposes as it represents a "balanced" portfolio of equities and fixed income.

Astor Investment Management LLC is registered with the Securities and Exchange Commission as an investment adviser. All information contained herein is for informational purposes only. This is not a solicitation to offer investment advice or services in any state where to do so would be unlawful. Analysis and research are provided for informational purposes only, not for trading or investing.
